EXECUTIVE SUMMARY

To maintain an efficient and consistent method of data collection and management, all vertebrate and invertebrate species detected and documented during field surveys for the Alberta Biodiversity Monitoring Program (ABMP) are entered onto datasheets, and subsequently a central database, using a unique species code. All vertebrate species codes are 4-letters and typically consist of the first few letters from a species “Common” name; some variations apply. Bird species codes follow those utilized by the American Ornithologists’ Union and Bird Studies Canada (Lepage 2005). All other vertebrate codes are similar to those used by Alberta Environment’s Biodiversity Species Observation Database. Red Squirrel (RESQ) appears in both the mammal and bird list because it is a species commonly documented during breeding bird surveys.

All invertebrate species codes were developed by the author based on the format currently used for vascular and nonvascular plants. Invertebrate codes are 7-letters and consist of the first 4-letters of the *Genus*, and first 3-letters of the *species* Latin name; some variations apply. Variations typically occur when species have similar spellings for their *species*’ names and when *subspecies* occur. Generally, the next letter of a species name will be used in cases for similar spellings (eg., *Anurida maritima* = ANURMAR and *Anurida martynovae* = ANURMAT) and in the case of a subspecies, letters from both species and subspecies names may be used (eg., *Trhypochthoniellus setosus canadensis* = TRHYSEC). The list of mite (*orbatida*) species was originally gathered from Behan-Pelletier and Eamer (2004) and the springtail (*collembola*) list was originally compiled from a North American species list (Nearctica.com). Variations in codes are highlighted in blue so field staff can distinguish differences between species and ensure the proper code is utilized. Codes that are highlighted in blue, and in **bold print**, indicate similar conflicts but with a different taxon (i.e., moss or lichen species). All vertebrate and invertebrate species codes are listed alphabetically by ABMP code for ease of reference.

Along with the ABMP species code, this document includes the internationally recognized “Nature Serve” codes given to all biodiversity, scientific names, and common names (when they exist).

All vertebrate species found in this document are ranked according to the 2005 General Status of Alberta Wild Species (Alberta Sustainable Resource Development 2006). Each ranking is conveniently colour-coded for ease of viewing.

At Risk	Any species known to be “At Risk” after formal detailed status assessment and designation as “Endangered” or “Threatened” in Alberta.
May Be At Risk	Any species the “May Be At Risk” of extinction or extirpation, and is therefore a candidate for detailed status assessment.
Sensitive	Any species that is not at risk of extinction or extirpation but may require special attention or protection to prevent it from becoming at risk.
Secure	A species that is not “At Risk”, “May Be At Risk”, or “Sensitive”.
Undetermined	Any species for which insufficient information, knowledge or data is available to reliably evaluate its general status.
Not Assessed	Any species that has not been examined.
Exotic/Alien	Any species that has been introduced as a result of human activities.
Extirpated/Extinct	Any species no longer thought to be present in Alberta (extirpated) or no longer believed to be present anywhere in the world (extinct).
Accidental/Vagrant	Any species occurring infrequently and unpredictably in Alberta (i.e., outside its usual range).
